# How to Install Bismark/Packages from GitHub

Here is a document for how to install a github package, if you have never installed one before:
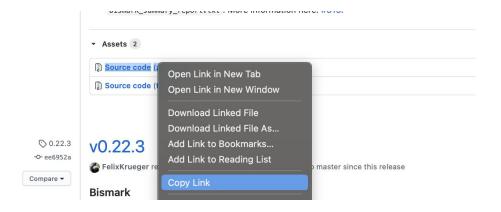

1. Go to the GitHub Page of a command tool, usually there will be instructions for installation.

Bismark Example

For most packages, they already build pip install or conda install. For Bismark, you can go to the **Release Page** and directly download the zip file and use the commands.

2. You can copy the link of v.0.23.0's source code.

Bismark v.0.23.0

3. Then on Cannon server, your working directory (such as ~/HW4), use **wget** to download files:

wget <link>

4. Use **unzip** to unzip .zip files.
   unzip <file_name.zip>

5. You should have bismark 0.23.0 in your working directory (wdr) now!
